MOTION**MD**® by **DJO**®

Release Notes

MotionMD Deployment - 1/9/2018

Release Features

This deployment may include bug/defect fixes, security enhancements, and data migration related issues. The below list contains all the items that will go to Production on 1/9/2018.

- **[Operations and Security]** Updated invalid login message to be more security compliant
  - added language to the message MotionMD displays when a User enters invalid credentials. The update was to make it more vague so it didn't alert the User to which credential was wrong. This tightens up our security compliance.
- **[Operations and Security]** Update reset password message to be more security compliant
  - added language to the message MotionMD displays when a User enters invalid credentials. The update was to make it more vague so it didn't alert the User to which credential was wrong. This tightens up our security compliance.
- **[Feature]** Inventory Report
  - This report allows Users to view all pertinent information related to Inventory Items. We also included excess stock and dead stock as part of this report.
  - Dead Stock column "YES" items are items that have not been placed on a PA in the last 90 days. The only outlier is if an Item has a stock record but no on-hand/par it will say NO. The Excess Stock Quantity is calculated by the following: (On-hand + Outstanding Restocks) - (PAs in Last 90 Days x .5). If there are no PAs created for that Item in the Last 90 Days it will calculate to say all but 1 item is overstock. So, On-hand of 4 and zero PAs in Last 90 days, Excess Stock Quantity will be 3. Leaving one on-hand.
- **[Benefits Verification v1]** Display list of errors
  - This allows Users to see a list of errors based on the carrier. If the carrier that is being verified provides error responses, they will be displayed in MotionMD.
- **[Bug]** Handle DJO Integrator request timeouts
